

Fibreglass Above Ground Storage Tank Systems

Ranging in size from small 300 diameter tanks to over 4.5 metres in diameter, Maskell Productions acid and alkaline storage and processing tanks are unequalled for long life and low operating costs. Engineered for high strength, Maskell Production tanks are built with some of the most advanced machinery available. Horizontal* and Vertical Fibreglass tanks are pre-engineered for heavy duty service and are moulded of rigid reinforced plastic. Since these tanks are lightweight they can be easily installed or moved, reducing installation costs and tank obsolescence. They are highly resistant (both inside and outside) to acids and alkaline solutions at ordinary temperatures and concentrations. They have excellent insulative properties, and keep heat losses at a minimum. In addition they are non-conductive and will not short-circuit. They are suitable for plating, pickling, rinsing, mixing, storing, acid cleaning and wash tanks. All tanks are engineered to local earthquake standards.

A full range of standard sizes, rectangular, vertical and horizontal cylindrical tanks and accessories are available.
